

TENSORORBIT EDA BOOTCAMP

DAY 3 CAPSTONE TASK BRIEF

Applied Exploratory Data Analysis | Business Dataset

Your Task

Choose one business dataset and perform a complete Exploratory Data Analysis (EDA). Your goal is to discover meaningful patterns or problems in the data and turn them into a clear business recommendation.

Choose One Dataset

- Supermarket Sales
- Cafe Orders
- Hotel Bookings
- E-commerce Orders
- Food Delivery
- Gym Memberships

What You Need to Do

1. Understand the dataset: inspect the rows, columns, data types and basic statistics.
2. Clean the data: check missing values, duplicates and unusual values where appropriate.
3. Explore the data: create your own business questions and analyse important variables.
4. Use Pandas, NumPy and Matplotlib to support your analysis.
5. Create suitable visualisations that help explain your findings.
6. Identify 2-3 meaningful findings or patterns from the dataset.
7. Give at least one clear business recommendation supported by your analysis.

Recommended EDA Flow

LOAD -> INSPECT -> CLEAN -> EXPLORE -> ANALYSE -> VISUALISE -> RECOMMEND

Questions to Guide Your Team

- What business question are we trying to answer?
- What patterns, differences, relationships or unusual values can we find?
- Which chart best communicates our result?
- What does the result mean for the business?
- What action should the business take based on our findings?

Expected Outcome

By the end of Day 3, your team should have a clear problem/pattern, supporting analysis and visualisations, and a business recommendation. On Day 4, each team will present its findings and recommendation in approximately 3-5 minutes.

Focus on explaining what the data means, not only on showing Python code.
